

6th December 2021

Dear Premiers, Chief Ministers, Attorneys-General and Health Ministers,

Re: The health reasons for raising the age of criminal responsibility to a minimum of 14 years of age

The undersigned health and medical organisations reiterate the call to raise the age of criminal responsibility to a minimum of 14 years of age on health grounds.

While prison is harmful for all children, the medical evidence and internationally accepted standards make it clear that 14 is the bare minimum governments must raise the age to in order to protect the rights and health of our children.

The current minimum age of criminal responsibility of 10 years of age in all states and territories across Australia is out of step with medical consensus regarding child brain development. Children under the age of 14 are undergoing significant growth and development, which means that they may not have the required capacity to be criminally responsible.¹ Research shows that immaturity can affect a number of areas of cognitive functioning “including impulsivity, reasoning and consequential thinking”. Scientific advances related to the understanding of child cognitive development favour a minimum age of criminal responsibility of at least 14, taking into account the time it takes for the adolescent brain to mature.²

There is now also clear evidence that children in the youth justice system in Australia have high rates of additional neurocognitive impairment, trauma and mental health issues.³ Given the high rate of neurodevelopmental delay experienced by children in youth prisons, some behaviours often reflect the developmental age of the child, which may be several years below their chronological age. Judging criminal responsibility on the basis of a chronological age is inappropriate for children who may have a much lower developmental age due to a number of medical and developmental conditions described in the following sections. The evidence overwhelmingly shows that when children in the very young age bracket of 10 to 13 years of age are forced through a criminal legal process during their formative developmental phases, they suffer immense harm.

Neurocognitive impairment in children caught in the criminal legal system

There is strong evidence that children in youth prisons in Australia have a very different neurodevelopmental and mental health profile compared to children who are not in custody. A recent study found that a third of children caught in the criminal legal system met the criteria for at least two mental health disorders and were twice as likely to experience high or very high psychological distress.⁴

A large multidisciplinary study of 99 children and young people sentenced to detention in Western Australia showed that 89% had at least one severe neurodevelopmental impairment.⁵ These included neurodevelopmental impairments in the areas of memory, language and communication, executive function, attention, cognition, motor skills, adaptive function, academic skills and brain structure or

neurology as well as intellectual disabilities, learning difficulties, speech and language disorders, and Fetal Alcohol Spectrum Disorder (FASD). Notably, the majority of children diagnosed with neurodevelopmental disorders had not been previously identified until the study occurred.⁶

These findings highlight that many, if not most, incarcerated children with a chronological age of 12 or 13 years are likely to have a much younger functional age, further impacting their impulsivity, reasoning and decision-making abilities.

As children driven into contact with the legal system are likely to have a lower functional age and have not yet developed critical cognitive functioning, we are strongly recommending the age of criminal responsibility be raised to at least 14 years of age.

Adolescence and the transition from primary school to high school

Many children aged 12 are still in primary school and many 13 year old children are just entering high school. Neurodevelopmental evidence demonstrates that adolescence is a unique, defining stage of human development. It is characterised by rapid brain development,⁷ increased impulsivity and sensation-seeking behaviour, coupled with a heightened vulnerability to peer influence which affects decision making capacity⁸. Documented evidence in the fields of child development and neuroscience indicates clearly that maturity and the capacity for abstract reasoning are still evolving in children aged 12 to 13 years, due to the fact that their frontal cortex is still developing.⁹

Transitioning from primary school to high school can be a challenge for a range of children who may require further education and social support. There is evidence that children at risk of experiencing a difficult transition to high school include those with emotional and behavioural difficulties, prior difficult experiences in primary school, and limited engagement in extracurricular activities.¹⁰

A range of behaviours in 10 to 13 year old children that are currently criminal under existing Australian law are better understood as behaviours within the expected range in a typical neurodevelopment of a 10 to 13 year old with a significant trauma history.¹¹ However, instead of being assisted by trauma-informed services to complete primary school and transition to high school, children in this cohort are often criminalised, arrested, strip-searched, and put in prisons.

Committing to develop a proposal to raise the age of criminal responsibility to just 12 is insufficient and does nothing to address the unmet need of the 456 children aged 12 and 13 who were sent to prisons between 2019 and 2020¹².

The evidence-based pathway to Raising the Age

There is an evidence-based pathway to raising the age which has already been set out by the ACT Government through the independent review headed by Emeritus Professor Morag McArthur on the steps required to best support this reform. The resulting [report](#) provides options for therapeutic and restorative care to reduce children and young people's interaction with the criminal justice system and outlines the service system and implementation requirements for raising the minimum age of criminal responsibility to 14.

Our call is firmly rooted in neurodevelopmental evidence, child development, and scientific research. We call on state and territory governments and the federal government to follow the lead of the ACT by immediately committing to Raise the Age to at least 14 without exception.
